Homepage: github.com/maxibor/pydamage

Pydamage, is a Python software to automate the process of contig damage identification and estimation. It uses a process akin to a likelihood ratio test to attempt to discriminate between truly ancient, and modern contigs originating from sample contamination.

1.1 Install

Pydamage is not yet on *pypi* nor *conda*, but you can already install it using *pip*, provided that you have access to this repository.

1.1.1 Install dependencies in conda environment

```
git clone git@github.com:maxibor/pydamage.git
cd pydamage
```

(continues on next page)

(continued from previous page)

```
conda env create -f environment.yml
conda activate pydamage
```

1.1.2 Install pydamage

- from source

```
python setup.py install
```

- from Github using pip

```
pip install git+ssh://git@github.com/maxibor/pydamage.git
```

1.2 CLI help

Command line interface help message

```
pydamage --help
```

See also *CLI*

`pydamage.main.analyze` (*bam*, *wlen*=30, *show_al*=False, *mini*=2000, *cov*=0.5, *process*=1, *outdir*="",
plot=False, *verbose*=False, *force*=False)

Runs the pydamage analysis

Parameters

- **bam** (*str*) – Path to alignment (sam/bam/cram) file
- **wlen** (*int*) – window length
- **show_al** (*bool*) – print alignments representations
- **mini** (*int*) – Minimum numbers of reads aligned to consider contigs
- **cov** (*float*) – Minimum coverage to consider contig
- **process** (*int*) – Number of processes for parallel computing
- **outdir** (*str*) – Path to output directory
- **verbose** (*bool*) – verbose mode
- **force** (*bool*) – force overwriting of results directory

Returns pandas DataFrame containing pydamage results

Return type pd.DataFrame

To access the help menu:

```
$ pydamage --help
```

The list of arguments of options is detailed below

3.1 pydamage

PyDamage: Damage parameter estimation for ancient DNA

Author: Maxime Borry

Contact: <borry[at]shh.mpg.de>

Homepage & Documentation: github.com/maxibor/pydamage

BAM: path to BAM/SAM/CRAM alignment file

```
pydamage [OPTIONS] BAM
```

Options

--version

Show the version and exit.

-w, --wlen <wlen>

Window length for damage modeling [default: 35]

-p, --process <process>

Number of processes [default: 2]

-m, --mini <mini>

Minimum reads aligned to consider reference [default: 1000]

- c, --cov** <cov>
Minimum coverage to consider reference [default: 8]
- s, --show_al**
Show alignments representations
- pl, --plot**
Make the damage plots
- verbose**
Verbose mode
- o, --outdir** <outdir>
Output directory [default: pydamage_results]
- force**
Force overwriting of results directory

Arguments

- BAM**
Required argument

CHAPTER 4

Indices and tables

- `genindex`
- `modindex`
- `search`

p

`pydamage.main`, 5

Symbols

-force
 pydamage command line option, 8

-verbose
 pydamage command line option, 8

-version
 pydamage command line option, 7

-c, -cov <cov>
 pydamage command line option, 7

-m, -mini <mini>
 pydamage command line option, 7

-o, -outdir <outdir>
 pydamage command line option, 8

-p, -process <process>
 pydamage command line option, 7

-pl, -plot
 pydamage command line option, 8

-s, -show_al
 pydamage command line option, 8

-w, -wlen <wlen>
 pydamage command line option, 7

-s, -show_al, 8

-w, -wlen <wlen>, 7

BAM, 8

pydamage.main (*module*), 5

A

analyze() (*in module pydamage.main*), 5

B

BAM
 pydamage command line option, 8

P

pydamage command line option

- force, 8
- verbose, 8
- version, 7
- c, -cov <cov>, 7
- m, -mini <mini>, 7
- o, -outdir <outdir>, 8
- p, -process <process>, 7
- pl, -plot, 8
